Chapter 11

Inferences for Population Standard Deviations

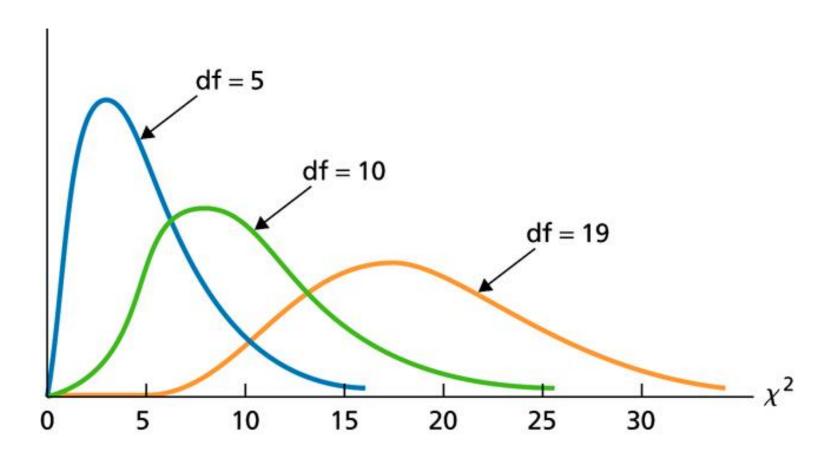

Section 11.1 Inferences for One Population Standard Deviation

Figure 11.1

 x^2 -curves for df = 5, 10, and 19

Key Fact 11.2

The Sampling Distribution of the Sample Standard Deviation[†]

Suppose that a variable of a population is normally distributed with standard deviation σ . Then, for samples of size n, the variable

$$\chi^2 = \frac{n-1}{\sigma^2} s^2$$

has the chi-square distribution with n-1 degrees of freedom.

Procedure 11.1

One-Standard-Deviation χ^2 -Test

Purpose To perform a hypothesis test for a population standard deviation, σ

Assumptions

- 1. Simple random sample
- 2. Normal population

Step 1 The null hypothesis is H_0 : $\sigma = \sigma_0$, and the alternative hypothesis is

(Two tailed) or
$$H_a$$
: $\sigma < \sigma_0$ or H_a : $\sigma > \sigma_0$ (Right tailed)

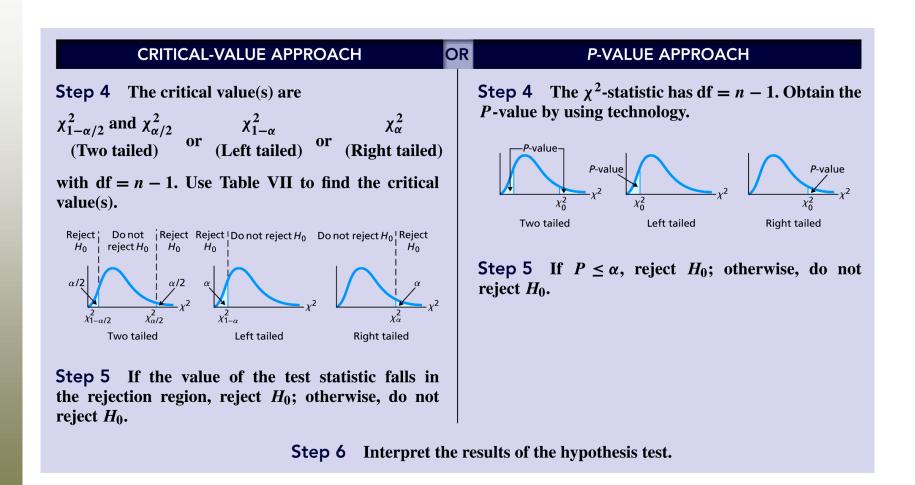

Step 2 Decide on the significance level, α .

Step 3 Compute the value of the test statistic

$$\chi^2 = \frac{n-1}{\sigma_0^2} s^2$$

and denote that value χ_0^2 .

Procedure 11.1 (cont.)

Procedure 11.2

One-Standard-Deviation χ^2 -Interval Procedure

Purpose To find a confidence interval for a population standard deviation, σ

Assumptions

- 1. Simple random sample
- 2. Normal population

Step 1 For a confidence level of $1 - \alpha$, use Table VII to find $\chi^2_{1-\alpha/2}$ and $\chi^2_{\alpha/2}$ with df = n - 1.

Step 2 The confidence interval for σ is from

$$\sqrt{\frac{n-1}{\chi_{\alpha/2}^2}} \cdot s$$
 to $\sqrt{\frac{n-1}{\chi_{1-\alpha/2}^2}} \cdot s$,

where $\chi^2_{1-\alpha/2}$ and $\chi^2_{\alpha/2}$ are found in Step 1, *n* is the sample size, and *s* is computed from the sample data obtained.

Step 3 Interpret the confidence interval.

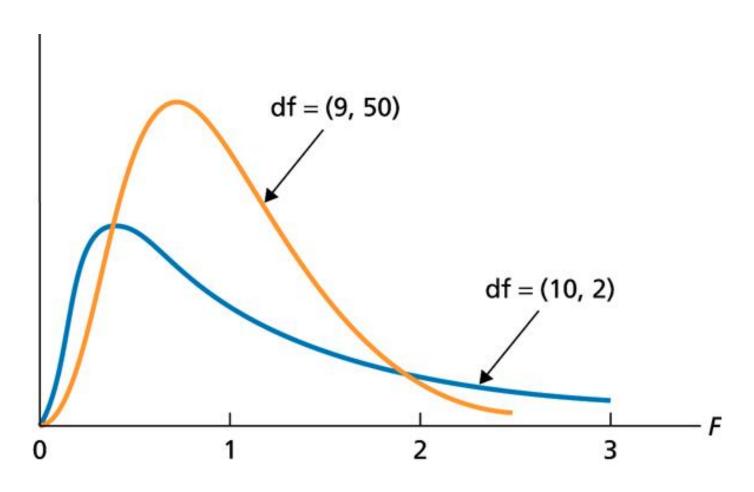

Section 11.2

Inferences for Two Population Standard Deviations, Using Independent Samples

Figure 11.7

Two different F-curves

Key Fact 11.5

Distribution of the *F*-Statistic for Comparing Two Population Standard Deviations

Suppose that the variable under consideration is normally distributed on each of two populations. Then, for independent samples of sizes n_1 and n_2 from the two populations, the variable

$$F = \frac{s_1^2/\sigma_1^2}{s_2^2/\sigma_2^2}$$

has the F-distribution with df = $(n_1 - 1, n_2 - 1)$.

Procedure 11.3

Two-Standard-Deviations F-Test

Purpose To perform a hypothesis test to compare two population standard deviations, σ_1 and σ_2

Assumptions

- 1. Simple random samples
- **2.** Independent samples
- **3.** Normal populations

Step 1 The null hypothesis is H_0 : $\sigma_1 = \sigma_2$, and the alternative hypothesis is

$$H_a: \sigma_1 \neq \sigma_2$$
 (Two tailed) or $H_a: \sigma_1 < \sigma_2$ (Left tailed) or $H_a: \sigma_1 > \sigma_2$ (Right tailed)

Step 2 Decide on the significance level, α .

Step 3 Compute the value of the test statistic

$$F = \frac{s_1^2}{s_2^2}$$

and denote that value F_0 .

Procedure 11.3 (cont.)

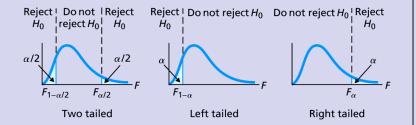

CRITICAL-VALUE APPROACH

P-VALUE APPROACH

Step 4 The critical value(s) are

 $F_{1-\alpha/2}$ and $F_{\alpha/2}$ or $F_{1-\alpha}$ or F_{α} (Two tailed) or (Right tailed)

with df = $(n_1 - 1, n_2 - 1)$. Use Table VIII to find the critical value(s).

Step 5 If the value of the test statistic falls in the rejection region, reject H_0 ; otherwise, do not reject H_0 .

Step 4 The *F*-statistic has $df = (n_1 - 1, n_2 - 1)$. Obtain the *P*-value by using technology.

Step 5 If $P \le \alpha$, reject H_0 ; otherwise, do not reject H_0 .

Step 6 Interpret the results of the hypothesis test.
